WP5 - Cost-benefit analysis

Mohamed GHAZEL
El-Miloudi EL-KOURSI
Agenda

1. Introduction of WP5 & CBA-CEA (10 mn), IFSTTAR
2. Lessons learnt from past projects (20 mn)
   • RESTRAIL (2010-2014)- REduction of Suicides and Trespasses on RAILway property. FP7
   • SELCAT (2006-2008) “Safer European Level Crossing Appraisal and Technology”. FP6
3. Presentation of SAFER-LC selected scenarios (UIC) (10 mn)
4. Discussion on
   • Various aspects to be considered in CBA
   • Identification of measurable/qualitative indicators

Conclusion of the session
WP5 – Cost- benefit analysis -Overview

- **Duration**: M6 → M36
- **Leader**: IFSTTAR
- **Contributors**: All
- **Total effort**: 50 M.M

**Objectives**

- Perform a comprehensive C/B analysis of the developed solutions, taking into account various aspects:
  - Economical
  - Social
  - Environmental
- Issue a concise set of recommendations pertaining to:
  - Technical specifications
  - Human processes
  - Organizational and legal frameworks
- ==> Implementation of the solutions + Feed into future international standard in rail and road → Safer LX
Lessons learnt from past projects (20 mn)

• RESTRAIL (2010-2014)- REduction of Suicides and Trespasses on RAILway property. FP7

• SELCAT (2006-2008) “Safer European Level Crossing Appraisal and Technology”. FP6
RESTRAIL project
11 Field tests in 8 countries

Map of RESTRAIL field tests

- Trespass prevention
- Suicide prevention
- Consequence mitigation

- Video enforcement & sound warning at 2 trespassing hotspots in open track + Education in 5 schools situated close to railway lines
- Mid platform fencing in 3 pilot test areas around London
- Forward facing CCTV
- Gatekeeper Programme
- Combination of fences, anti-trespass panels, video camera and communication campaign
- Education outside schools (railway museum) + Warning signs and posters at a trespassing hotspot in a station
- Computer Based Training module for responding bodies
Development of a method for the evaluation of measures

An initial set of 83 preventive measures to reduce the occurrence of suicide or trespassing has been grouped into 38 families of measures in which the modes of action for incidents and accidents are similar.

Several criteria were chosen for the evaluation procedure:
(1) durability of effects,
(2) costs and benefits (based on expert judgment and not on calculation of the C/B ratio),
(3) integration with other policy measures,
(4) impact on railway operations,
(5) impact on people and jobs,
(6) technological issues,
(7) environment,
(8) acceptance,
(9) transferability issues.
Lessons learnt from the CEA / CBA

Mostly CEA (and mini CBA in two cases) were performed with the cost and effectiveness data collected within the pilot studies. Unfortunately, it was not possible to perform any preliminary economic analyses in the case of four pilot tests (Dutch gatekeeper programme, German gatekeeper programme, training based on CBT and Forward Facing CCTV).

The RESTRAIL frame was very efficient to develop field tests of measures but cannot gather the whole set of data required for conducting CEA or CBA to actually compare between the various options in the same (or very similar) locations.

The greatest problems in CBA is to obtain valid and reliable monetary valuations of all relevant impacts.

SAFER-LC CBA Workshop, UIC, March 27th 2018
Cost Benefit analysis Major tasks

There are three essential principles of the approach to cost benefit analysis:

• **Analysis of the quantitative risk**, in order to estimate the safety gains inherent in a given investment or way of working;

• **Economic analysis**, in order to calculate the net cost of a given safety-related investment or way of working;

• **Ethical and social analysis**, in order to determine at least the relative value of different safety gains, and if possible their absolute value.
Analysed case study AHB with obstacle detection

Obstacle detection

Train

Warning lights activation

Car

Warning lights, half barrier

LC Danger Zone
1) Radio Communication to Train

2) Obstacle announcement by one signal

3) Obstacle announcement by two signals

Technical implementations of the obstacle detection
Analysis of the quantitative risk: Road traffic consideration

**Type 1** represents the road vehicles whose drivers are violating the level crossing warning system deliberately or non-deliberately. It is considered that road vehicle of the type 1 doesn’t stay in danger zone longer than 3 seconds.

**Type 2** represents road vehicles which enter the danger zone at the time when there are no warning lights activated but is forced to stop without having the possibility to clear completely before 2 minutes elapse.

**Type 3** represents the road vehicles whose drivers are entering the danger zone deliberately despite activated warning lights. The model assumes that the presence of the vehicle of the type 3 in the danger zone can take up to 5 minutes.

SAFER-LC CBA Workshop, UIC, March 27th 2018
Analysis of the quantitative risk
Railway traffic consideration

Nominal Speed 160 km/h

Emergency Braking coefficient = 0.7 m/s²

At nominal speed, it needs 44 sec or 1400 m to stop
Quantitative risk analysis - summary

Obstacle detection
Accidents caused type 1 events e.g. zigzagging are not prevented

eliminates accidents type 2 events (e.i. vehicles in the danger zone before the lights activated) (30%). Therefore the expected safety benefit is limited

Reliability of 99% of the obstacle detection should be sufficient
**Economical analysis**

$\Delta R = \text{efficacy of a measure (assessment of risk-reduction potential and monitoring of the risk),}$

$\Delta C = \text{the costs of a measure,}$

$\frac{\Delta C}{\Delta R} = \text{cost-benefit ratio,}$

</tr>
</tbody>
</table>

Cost-benefit ratio \( ΔC / ΔR = 118,000,000 \text{ €} / 158,203,125 \text{ €} = 0.75 \)

\( 0.5 < 0.75 < 2 \) - well-balanced
Social analysis and ethical issues

Benefits:
Road users would feel more secure crossing the LC
Road users see good use of tax money

Disbenefits:
LC actors including drivers, train driver are over relying on obstacle detection devices
Possible increase to road users’ level of risk tolerance which makes more prepared to engage in risky situations (risk compensation)
Road users pay less attention to other warning signs around the LC
Road users’ mental model of the function of the LC may be altered
Residual risk: Residual risk reduction

How to reduce the accidents caused by event of the Type 1?

Traffic Rules Enforcement

- Application on 500 most critical level crossings assuming 80% of all accident risk
- Assumption of 50% reduction of the influencible risk
### Economical analysis (traffic rules enforcement)

<td></td>
<td></td>
<td><strong>181,933,594</strong></td>
</tr>
</tbody>
</table>

Cost-benefit ratio $\Delta C / \Delta R = 20,000,000 \text{ €} / 181,933,594 \text{ €} = 0.11$

$0.1 < 0.11 < 0.5$ – favourable
Social analysis (traffic rules enforcement)

Benefits:
Increase in danger perception $\rightarrow$ Higher compliance of road users to LC rules because they know that there is a real personal benefit
Road users would feel more secure crossing the LC
Road users are less subject to peer influence $\rightarrow$ Seeing other people ignore warnings will not reduce perception of danger

Disbenefits:
Aversion of road drivers $\rightarrow$ privacy issues
Road users may be distracted with technologies used to enforce traffic rules
Road users with a high tolerance for risk may want to beat the supervision cameras and engage in risky actions
Discussion on
Various aspects to be considered in CBA
Identification of measurable/qualitative indicators
Open discussion & questions

1) CEA/CBA
2) Values of life
3) Accident cost (Property damage)
4) Values of delays (passenger, freight)
5) LC data
6) Factors to determine risky LC (FB, HB Road signal and unprotected)
7) Cost of measures
8) Effects which usually are not monetarized Accident
9) Social analysis and ethical issues
10) Other projects
CBA/CEA

Cost benefit analysis (CBA) is an important part of the cycle of understanding and quantifying risk, modelling and monetarising its effects and the cost of reducing it, and then applying expert judgement to decide which option to adopt.

Cost-Effectiveness Analysis (CEA) - this technique compares the projected costs for a range of proposed risk control alternatives, all intended to meet the same objective. CEA is useful most often when the benefits of a risk reduction scenario are difficult to quantify in monetary terms but the government wishes to know which option will achieve social benefits or government objectives most cost effectively.
CBA/CEA

Cost Effectiveness Analysis (CEA) = \[ \frac{\text{Number of accidents / incidents prevented}}{\text{Cost of implementation}} \]

Cost Benefits Analysis (CBA) = \[ \frac{\text{Present value of all benefits}}{\text{Present value of the implementation costs}} \]

CEA can be complemented with a CBA, if the effect the measures can be translated into money.
<table>
<thead>
<tr>
<th>CEA</th>
<th>CBA</th>
</tr>
</thead>
<tbody>
<tr>
<td>Advantages</td>
<td>Disadvantages</td>
</tr>
<tr>
<td>- is easier to calculate benefits in physical terms</td>
<td>- can only be used for ranking measures with a common (single) target,</td>

Values of life

Country specific values or EU-averaged values?
The values applied in the national frameworks vary considerably across countries. For example, the values used for a fatality lie between approx. €200,000 and approx. €1,650,000 and great differences between regions can be observed.
Values of life

**Country specific values:**
*More* acceptable when the values used derive directly from the national context;
Specific unit values may not exist or be of poor quality for individual countries (e.g. differences in the values of human lives between countries may not be acceptable to decision-makers);
Lack of good quality data covering all member states;

**EU-averaged values:**
Simplify the appraisal process and increase transparency;
May be acceptable on the basis of perceived equity;
not fully reflect differing preferences and resource costs;
Dependent values, from local authorities;
Q2: Values of life

*Country specific values or EU-averaged values?*

*Give 2 arguments for your proposal:*
Accident cost (Property damage)
Q3: Accident cost (Property damage)

Which are the five main elements to be considered in the accident cost?
Values of delays (passenger, freight)

Values of Time (VT) refer to the monetary value of delays incurred by users of rail transport (passengers and freight customers) as a consequence of accidents or incidents. It is proposed to be calculated using the following formula (from ERA 2013, p.):

- **Value of time for a passenger of a train (VTP)** = [VT of work passengers]*[Average percentage of work passengers per year] + [VT of non-work passengers]*[Average percentage of non-work passengers per year]

  VTP is measured in € per passenger per hour.

- **Value of time for a freight train (VTF)** = [VT of freight trains]*[(Tonne-Km)/(Freight Train-Km)]

  VTF is measured in € per freight tonne per hour.
Values of delays (passenger, freight)

Do we need to integrate de delay of neighbors’ lines?
## LC data

- **Number of heavy injured persons**
  - Full Barrier
  - Half Barriers
  - Road side Signal
  - Unprotected
Q6: LC data

Do we need to integrate the slight injuries?
Factors to determine risky LC (FB, HB Road signal and unprotected)

Classifying the more critical level crossings is done by calculating a factor, called the “factor K”. The formula is given by the following:

$$\text{Factor K} = \eta \times n_{\text{acc}} / 10^3$$

$\eta$ is the “moment of circulation” calculated as follows:

$$\eta = \text{number of trains} \times \text{number of road vehicles (over one year)}$$

$n_{\text{acc}}$ is the number of incidents (knocked barriers) and of accidents over 10 years.

The factor K is calculated for each level crossing and gives a list of level crossings to be improved.

Nota: Expert’s judgment is required.
Q6: Factors to determine risky LC (FB, HB Road signal and unprotected)

(1) Expert’s judgment
Please indicate 2 more factors to be analysed?
Cost of measures

Installation cost
Training and education cost (staff)
Operational cost
Maintenance cost
False Alarm (if any) - delay time
Renewal cost saving (if any)
...

Q7: Cost of Safer-lc measures

Are there any more main costs to be considered for a given measure?

Equipment
Installation cost
Training and education cost (staff)
Operational cost
Maintenance cost
False Alarm (if any)- delay time
Renewal cost saving (if any)
...

Which duration (10, 15 or 20 years) is more appropriate for economic evaluation of suggested measures?
Q8: Effects which usually are not monetarized Accident

Are there any more effects to be considered for a given measure?

- Easy issues of implementation;
- Easy issues of use;
- Competitiveness of the European Railway industry;
- Effects on the environment;
- Customer satisfaction with the safety system;
- Capacity performance;
- The possibilities of by-passing the system;
- Maturity of the technology
Q9: Social analysis and ethical issues of Safer-lc solution

Identify the benefits and disbenefits for given solution?
Past projects to be analysed
