solutions for society, economy and environment

### SAFER-LC project: Safer Level Crossings by integrating and optimizing road-rail infrastructure management and design

**Grigore M. Havârneanu**, UIC, France

**Annika Dreßler & Jan Grippenkoven**, DLR, Germany

**Anne Silla**, VTT, Finland

**Eduardo Prieto**, FFE, Spain

**Marie-Hélène Bonneau**, UIC, France

Hosted and organised by:

*Austrian Ministry  
for Transport,  
Innovation and Technology*

**austriatech**

Co-organised by:

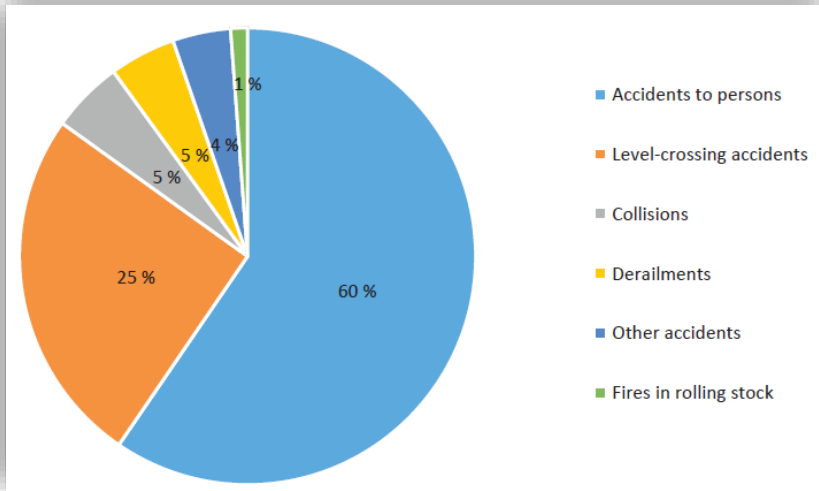

Together with:

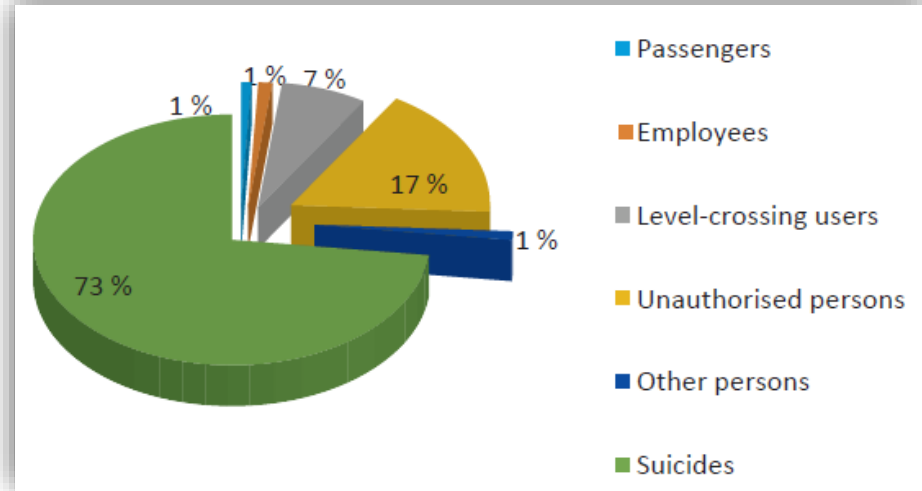

alice

# Background

Breakdown of significant accidents per type (EU-28; 2011-2015)

Relative share of fatalities per victim category among all fatalities (EU-28; 2011-2015)

Source: European Agency for Railways (ERA, 2017)

# SAFER-LC: Key facts

- Framework: H2020 Call 2016-2017  
Mobility for Growth
- Topic: MG-3.4-2016: Transport  
infrastructure innovation to increase  
the transport system safety at modal  
and intermodal level (including nodes  
and interchanges)
- Proposal selected in January 2017
- [www.safer-lc.eu](http://www.safer-lc.eu)

## Key facts

Time frame: 01/05/2017  
– 30/04/2020

Budget: 4.8 M€

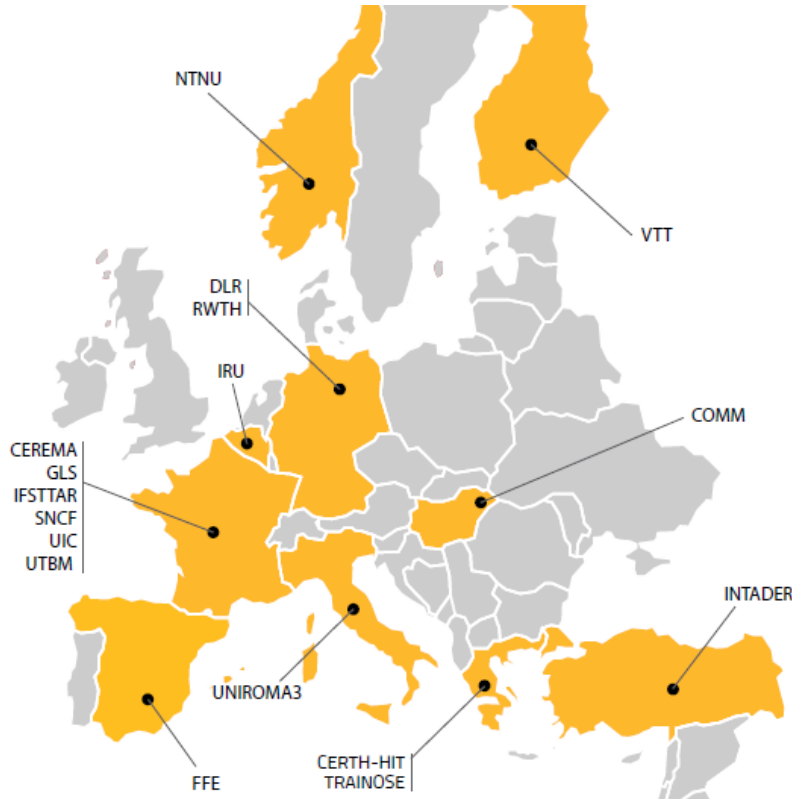

Work effort: 487 PM

# Consortium

17 partners from 10 countries

- Coordinator: UIC Security Division
- 1 association
- 3 UIC members (IMs, RUs)
- 6 research centres
- 4 universities
- 2 industries

# Objectives

Improve **safety** and minimize risks at and around LCs

Focus on **technical solutions** (early detection, communication between vehicles)

Focus on **human processes** (adapt the infrastructure to end-users, human centred measures, VRUs)

Develop a **toolbox** which will integrate all the project results and solutions

# Methodology

- **Analysis of LC safety systems** and definition of needs and requirements of the rail and road users for safer level crossings (WP1)
- **Development of innovative measures:** human centered low-cost measures (WP2) & technical solutions (WP3)
- **Lab-tests, field-tests and evaluation** of the measures (WP4)
- **Cost-benefit analysis** and elaboration of recommendations (WP5)
- Collection of all results in a **toolbox** (WP6)

# Human Factor at LCs

Design for 'self-explaining' and 'forgiving' infrastructure

## Analysis of HF in LC safety systems

- Review a bibliographical database
- Literature analysis according to a standard template
- Identify key safety indicators concerning human errors and violations

## HF methodological framework

- Analyse how measures can be better adapted from a user perspective
- Identify evaluation criteria
- Focus on specific VRUs

## Design and evaluation of HF low-cost measures

- Collect information on countermeasures
- Design new measures and/or upgrade existing ones
- Evaluate the measures

# Sets of criteria

## Background classification criteria

- Feasibility for LC type
- Feasibility for environmental conditions
- Feasibility for type of user
- Feasibility for further socio-demographical factors
- Intended effect mechanism

Estimation of **short term** safety effects on road user behaviour  
(These refer to direct, immediate reactions)

## Criteria to assess the behavioural safety effects

- Conspicuity factors
- Cognitive factors
- Rule knowledge
- (Risky) decision-making

Estimation of **long term** safety effects on road user behaviour  
(These involve learning processes and experiences leading to behavioural adaptation or indirect effects on safe behaviour)

## Criteria to assess the user experience and social perception

- Acceptance
- Trust in the system (Reliability)
- Level of self-explanatory nature (Usability)

## Other assessment criteria

- Integration with road and railway environment, other safety measures

# Criteria for behavioural safety effects

Function involved	Indicator (i.e. behavioural output that can be measured as dependent variable to assess the safety effect)	Factors influencing the behavioural effect
Detection	<p><b>Detectability of approaching LC and / or train</b></p> <ul style="list-style-type: none"> <li>Speed and timing of detection</li> </ul> <p><b>Prevalence of errors</b></p> <ul style="list-style-type: none"> <li>Number of errors (i.e. perception) / correct detections</li> </ul>	<ul style="list-style-type: none"> <li>Sight distances</li> <li>Signs</li> <li>Crossing angle</li> </ul>
Identification	<p><b>Road users' workload</b></p> <ul style="list-style-type: none"> <li>Road users' focus of attention (focus on other road users and/or road)</li> <li>Looking left and right (yes/no, how often)</li> <li>Timing of reactions</li> </ul> <p><b>Prevalence of errors</b></p> <ul style="list-style-type: none"> <li>Type and number of errors (e.g. attention, memory etc.)</li> </ul>	<ul style="list-style-type: none"> <li>Tiredness / fatigue</li> <li>Overload with stimuli</li> <li>External and visual distraction</li> <li>Gender, age, disability</li> <li>Use of addictive substances</li> </ul>
Rule knowledge	<p><b>Correct action to the correct hint / cue</b></p> <ul style="list-style-type: none"> <li>Knowing the hint / cue from the traffic rule / traffic sign etc.</li> <li>Knowing required behaviour (i.e. what to do when you detect the hint / cue)</li> </ul> <p><b>Prevalence of errors</b></p> <ul style="list-style-type: none"> <li>Number of errors / correct replies</li> </ul> <p><b>Prevalence of violations</b></p> <ul style="list-style-type: none"> <li>Type and number of violations</li> </ul>	<ul style="list-style-type: none"> <li>Knowledge and understanding of the correct action</li> </ul>
Risky decision-making	<p><b>Risky behaviours and prevalence of violations</b></p> <ul style="list-style-type: none"> <li>Type and number of violations (at active LC)</li> <li>Speed choice / Approach speed (at passive LC) (+/- km/h)</li> <li>Trajectories</li> <li>Verification behaviours for frequent users</li> <li>Time to collision (TTC) when a train is coming</li> <li>Interaction with other road users</li> </ul> <p><b>Prevalence of errors</b></p> <ul style="list-style-type: none"> <li>Type and number of errors (e.g. biased decision)</li> </ul>	<ul style="list-style-type: none"> <li>Perception of probability</li> <li>Perception of dangerousness</li> <li>Perception of legal consequences</li> <li>Perception of cost-benefits</li> <li>Motivational factors</li> <li>Personality of the road user</li> <li>Frustration and impatience</li> <li>Suicide or vandalism</li> </ul>

**ABOUT SAFER-IC**  
Over the past few years, one person has been killed and close to one seriously injured every day on level crossings. Therefore, SAFER-IC (Safer level crossing by integrating and optimizing road-rail infrastructure management and design) aims to improve safety and minimize risk by developing a fully integrated cross-modal set of innovative solutions and tools for the proactive management and design of level-crossing infrastructure.
